

# Cleaning

---

- To prevent internal rust and potential starting problems, keep water out of the muffler.
- Keep brake parts dry. Water in the brake mechanism affects braking performance.
- Polish painted surfaces and plastic parts gently. Strong rubbing with wax or polishing compounds can wear down the paint coating and cause discoloration.

After cleaning the motorcycle, start the engine and test the brakes (keep clear of other traffic and keep a low speed).

If necessary, apply the brakes periodically while riding at reduced speed until they dry out.

- Dry and lubricate any moving parts that may be affected by water.
