## Wheels

Installation

- 1. Reverse the removal procedure. Make sure the lug (5) on the fork leg is located in the slot (6) in the brake panel.
- 2. Torque the front axle nut to: 44 lbf·ft (59 N·m , 6.0 kgf·m)
- 3. Check front brake adjustment (page 90).

If a torque wrench was not used to install the wheel, see your dealer as soon as possible to verify proper assembly. Improper assembly may lead to loss of braking capacity.
