

Riding with Cruise Control

Cruise Control

The cruise control system allows you to maintain a steady speed between 30 – 100 mph (48 – 161 km/h). When cruise control is on, your speed will still vary slightly, particularly going up and down hills.

Cruise control is intended for use only on straight, uncongested highways. Do not use cruise control on city streets, winding roads, during bad weather, or at any other time when you need total control of the throttle.

WARNING

Improper use of the cruise control can lead to a crash.

Use the cruise control only when traveling on open highways in good weather.
